DENTEX: 3,653 PNG files, 2,716 distinct radiographs

labeled: quadrant 693, enumeration 634, enumeration-disease 705

excluded: official test set (Turkish taxonomy); 50 unlabeled demo images

↓ *1,133 distinct labeled radiographs*

Group by pixel SHA-256, then split 0.70 / 0.10 / 0.10 / 0.10

identical films form one group; seed 42; assignments are append-only

↓

Train	**Val.**	**Cal.**	**Test**

Split	**Films**	**Role**
Train	794	fit network weights
Validation	113	epoch selection; validation metrics
Calibration	113	uncertainty thresholds; temperature
Test	113	final metrics; every use in the ledger

LEAKAGE CHECKS (2026-10-15)

Check	**Result**
file-hash overlap, all split pairs	0
training / epoch-selection films vs. test	0
near duplicates, pixel correlation ≥ 0.97	0 confirmed
two films of one patient	not checkable

No patient IDs exist in DENTEX. The test split was used once per model (2026-10-14).
